Description:

This command encodes and prints Maxi Code symbol data saved in the storage area.

Remarks:

■ In standard mode, this command is available only when printer is at the beginning of a line or the printer buffer is empty.
■ A symbol exceeding the printing area in size can not be printed.
■ Printing operation is not processed under the following conditions:
- There is no data. (Function 280 is not executed)
- The number of numeric characters exceeds 138
- The number of alphanumeric characters exceeds 93
- When mode 2 is selected, the primary message does not include all of the following:

Primary Message	Data Number	Character
Postal code	1~9	Numeric
ISO country code	1~3	Numeric
Service type code	1~3	Numeric

- When mode 3 is selected, the primary message does not include all of the following:

Primary Message	Data Number	Character
Postal code	1~6	Setting Code A
ISO country code	1~3	Numeric
Service type code	1~3	Numeric

■ Modes 2 and 3 are executed according to the following procedures:
(RS, GS indicates the control code of MAXI CODE. y indicates the 2-byte numeric data.)

a) 9-byte data including ” [)>”,”RS”,”01”,”GS”,”yy” are regarded as the Header.
- The next data following the Header is the Primary Message.
- When printing, the Header is placed at the beginning of the Secondary Message.

b) When Header data is absent, the data is regarded as Primary Message.
c) In the Primary Message, GS is used as the separator that divides message into Postal code, ISO country code, and Class of service. This GS is ignored.
d) All data of the Secondary Message is regarded as symbol data.

■ In mode 4, 5, 6, all of the data in the symbol storage area is regarded as Primary Message and Secondary Message.
■ For error correction codeword, the Reed-Solomon algorithm is employed.
■ The following data is automatically added during the encoding process:
- Position sensor pattern
- Position pattern
- Error correction code text
- Mode separator
- Pad code text

■ In standard mode, the paper feed amount set by the paper feed setting command does not affect printing of the symbol. The printing position returns to the left side of the printable area after printing the symbol.
■ In page mode, the printer stores the symbol data in the print buffer without executing actual printing.
■ The quiet zone is not included in the printing data. Be sure to include the adequate quiet zone for executing of this command.

- m specifies macro executing mode as shown below.

m	Function
0	Executes the macro r times continuously at the interval specified by t.

GS a

Function: **Enable/Disable Automatic Status Back (ASB)**

Code:

ASCII	GS	a	n
Hex	1D	61	n
Decimal	29	97	n

Range: 0 ≤ n ≤ 255

Default: n = 0

Printers:

Description:
- This enables or disables ASB (Automatic Status Back) according to n.
  - ASB is enabled when n > 0.

Remarks:
- ASB is the function that transmit the printer status such as cover open/close and Online/Offline] continuously at the time interval specified regardless of the status change if ASB is enabled. Using this ASB function, the host can check to see if the printer is running properly.
- Once ASB has been enabled, the printer continues to transmit the current printer status at the specified interval until ASB is disabled.
- When n = 0, ASB is disabled. The printer stops transmitting the status.
- With parallel and USB interface, the printer status is transmitted whenever the host computer changes to the reverse mode regardless of the printer status change. It is recommended that the periodic time interval at which the host changes to reverse mode is more than 500ms in order to receive the correct status.
- With serial interface, ASB status is transmitted continuously at the interval of 1 sec even if the status is not changed.
- The setting of this command remains effective until ESC @, printer reset or power cycling is executed.
